Relation b/n Various Temperature Scales

$$\frac{C}{100} = \frac{F - 32}{180} = \frac{R}{80} = \frac{K - 273}{100} = \frac{Ra - 460}{212}$$

$$\frac{1000}{100} = \frac{100}{100}$$

$$\frac{C}{100} = \frac{F-32}{180} = \frac{F-32}{180} = \frac{K-27}{100}$$

$$\frac{C}{100} = \frac{F - 32}{180} = \frac{K - 27.3}{100}$$

Convention LiaET =>

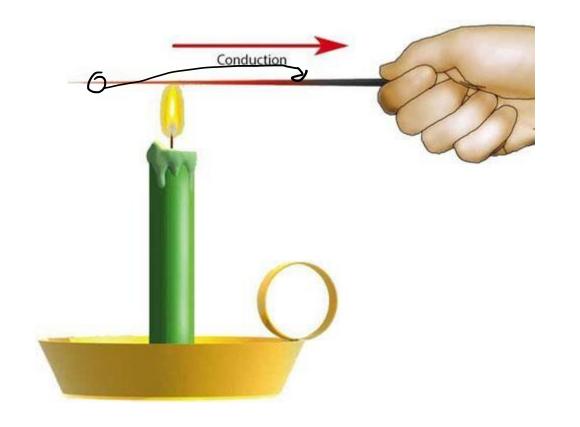

Radiation Palary 1=)

The transfer of energy, such as heat or an electric charge, through a substance. In heat **conduction**, energy is transferred from molecule to molecule by direct contact; the molecules themselves do not necessarily change position, but simply vibrate more or less quickly against each other

is the transfer of heat by the movement of a fluid (liquid or gas) between areas of different temperature. Warm air is less dense than cold air, and so **convection** currents can form in the presence of a temperature gradient
